Scope

This archive supports editorial and peer-review inspection of the manuscript. It contains the retained experimental records, paired summaries, frozen simulator and evaluation source, predictor weights, statistical verification code, and a separate ROS 2/Gazebo/RViz system diagnostic. No generative-AI image or figure component is included.

Data groups

- **Legacy clean comparison:** 960 selected method records from four constrained maps, two robot counts, and 30 matched seeds.
- **Gaussian observation study:** 3,840 method–seed records covering four scenarios, two robot counts, 30 seeds, four noise levels, and four methods.
- **Temporal and dropout extensions:** one 1,920-record AR(1) study and two 1,920-record short-dropout studies.
- **Prediction-quality diagnostic:** 1,440 case–method–noise rows with ADE, FDE, effective horizon, and candidate-response spread.
- **Gazebo boundary:** retained ten-seed, eight-robot summary and paired differences. The historical raw logs are not locally available and are not claimed as replayable data.
- **ROS 2/Gazebo/RViz trace:** synchronized four-robot records and real GUI captures for one retained seed. This diagnostic is not pooled with the ten-seed boundary study.

Code and integrity

The `code` directory contains the frozen observation-noise simulator, the prediction-quality runner, a retained data-figure generator, ROS 2 metric-export code, and `verify_archive.py`. The latter checks the expected row counts, balanced method keys, duplicate keys, and every digest in `SHA256SUMS.csv`. The release-time result is recorded in `verification_report.json`.

Access and reuse

No persistent repository identifier or public reuse licence has yet been assigned. These files are supplied for editorial review, peer review, and verification. Original code, data, predictor weights, and third-party dependencies remain subject to the conditions stated in `DEPENDENCIES_AND_LICENSING.txt`.
